***Election/Restrictions***

Claims 3, 6, 8, 13-14, 17-22, 48 and 62 are pending in the application.

Restriction to one of the following inventions is required under 35 U.S.C. 121:

- I. Claims 3, 6, 8, and 13-14, drawn to polynucleotides, classified in at least for example, Class 536, subclass 23.1.
- II. Claims 17-21, drawn to polypeptides, classified in at least for example Class 530, subclass 350.
- III. Claim 22, drawn to antibodies, classified in at least for example Class 530, subclass 387.1.
- IV. Claim 48, drawn to a method of inhibition by administering a protein, classified in at least for example Class 514, subclass 12.
- V. Claim 62, drawn to a method of screening expression of nucleic acids, classified in at least for example Class 435, subclass 6.

The inventions are distinct, each from the other for the following reasons.

The polynucleotide and polypeptide products of groups I and II can be shown to be distinct, each from the other. Although the polynucleotides and polypeptides are related as the claimed polynucleotide is asserted to encode the claimed polypeptide, they are distinct inventions because they are physically and functionally distinct chemical entities, and the protein product can be made by another and materially different process, such as by synthetic peptide synthesis or purification from the natural source. Further, the DNA may be used for processes other than the production of the protein as evidenced by the methods of at least groups IV and V. The antibody product of group III is structurally and functionally distinct from the polynucleotides of group I and polypeptide product of group II. The methods of groups IV-V can be shown to be distinct, each from the other, as they have different starting materials, method steps, and goals. These methods can be shown to be distinct from the products of groups I-III, as each of these products is either not used in the methods of groups IV-V or has uses unrelated to these methods. For example, the polynucleotides can be used to make the protein or as probes, the polypeptides can be used to make antibodies, and the antibodies can be used in methods of purification. Each group would require a non-coextensive literature search.

Because these inventions are distinct for the reasons given above and have acquired a separate status in the art as shown by their different classification and the necessity for non-coextensive literature and sequence searches, restriction for examination purposes as indicated is proper.

Applicant is advised that the reply to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed (37 CFR 1.143).
